Note: see Table 1 for a definition of each conservation status rank. NatureServe reports range ranks (e.g., S1S2) when there is uncertainty about the conservation status of a particular species. In this report range ranks were rounded to the higher rank (i.e., S1 in the example) or averaged (S2S4 to S3). The original range rank for each species can be obtained at <http://www.natureserve.org>

Appendix 2. Methods of Analysis

A. Species Exclusions

The following groups were excluded from analysis in this study. A full list of individual species is provided in Appendix 1.

Populations

Populations of species at risk were not included in the analysis since comprehensive lists for most groups do not exist. Only records indicating a species and subspecies in the Species Level field of the Conservation Data Centre's (CDC) B.C. Species and Ecosystems Explorer¹ were considered.

No status

Species listed as ‘no status’ in the B.C. Status field of the Conservation Data Centre’s (CDC) B.C. Species and Ecosystems Explorer² were excluded from the analysis. ‘No status’ species were generally the parent species of subspecies that exist in B.C. ‘No status’ records were excluded so as not to double count species.

Exotic or Introduced Species

Species considered ‘exotic’ in the B.C. Status field of the Conservation Data Centre’s (CDC) B.C. Species and Ecosystems Explorer³ were excluded from the analysis. Birds listed as exotic or introduced in Cannings (1998) were also excluded from the analysis. Amphibians considered exotic by E-Fauna B.C. were excluded from the analysis.

Accidentals

Species listed as ‘accidental’ in the B.C. Status field of the Conservation Data Centre’s (CDC) B.C. Species and Ecosystems Explorer⁴ were excluded from the analysis. Birds listed as accidental in Cannings (1998) were also excluded from the analysis.

Marine Species

Marine species were excluded from the analysis as their protection and recovery under law is not the responsibility of the province, but the federal government instead. These species were generally listed as ‘cetacea’ in the Order field of the Conservation Data Centre’s (CDC) B.C.

Species and Ecosystems Explorer⁵, while other non-cetacean marine species were simply recognized and removed.

Non-vascular Plants

Non-vascular plants (bryophytes, liverworts and hornworts) were excluded from the analysis since taxonomic classifications are incomplete and/or their conservation status remains largely unknown for most members of the group.

Species of Unknown or Mixed Origin

Vascular plants of unknown origin or mixed native and exotic origin according to Meidinger et al. (2004) were excluded from the analysis.

B. Taxonomic Lists Used to Enumerate the Species Richness of Major Wildlife Groups

Terrestrial Mammals

The complete species and subspecies list for terrestrial mammals in B.C. was obtained from the Royal B.C. Museum mammal index⁶ and the Conservation Data Centre (CDC).

Ministry of Forests and Range: Meidinger, Del; Lee, Tina; Douglas, George W.; Britton, Greg; MacKenzie, Will.; Qian, Hong. 2004. British Columbia plant species codes and selected attributes. Version 5 Database. Research Branch. B.C. Ministry of Forests.⁷

Amphibians

The complete species and subspecies list for amphibians in B.C. was obtained from the CDC and E-Fauna B.C.⁸
